

# WINTER PERFORMANCE NOTICE

**NOTE:** The Solar Dock Dots are the smallest solar light ever created: As Such the solar panel is affected by weather conditions and seasons more than any of our other solar products. Direct sunshine and high sun angles are important for achieving Maximum performance for the Solar Dock Dots

Winter Sunlight has a very low angle depending on your latitude:

The charging power can be 4-8X Lower than during summer time.

The sunlight charging time during a winter day is only about  $\frac{1}{2}$  or less than that of a summer day.

For this product winter performance is greatly affected based on your latitude location & amount of direct sunlight your solar dock dot receives. Please understand the winter performance will be dramatically reduced due to being such a small solar light product.
